New Manager at Economy Market in Safeway Store

R. L. Ashton has been appointed resident manager of the Economy Meat Market in the Safeway Store in Torrance. Mr. Ashton has had 25 years experience in cutting meats and promises local buyers a high type of meat service.

New Council Will Organize Monday

The City Council will meet next Monday night at 7:45 to organize. All three councilmen elect will be sworn in and a mayor elected.

OBITUARY

Mrs. Pairsyett Young, age 68, wife of Balaam Young residing at Western Avenue Court, died at Allynmore Sanitarium, Los Angeles, on Saturday April 7, at 10:30 a. m. Death closed an illness of eighteen months' duration.

Mrs. Young was a native of Tennessee, and moved to Torrance with her husband five and one-half years ago.

She is survived by her husband, Balaam Young, and one son, S. M. Young, 812 Beech street, Los Angeles.

Funeral services were conducted Monday April 9, from Stone & Myers chapel, Rev. J. W. Green of the Torrance Baptist church officiating. Interment was made at Roosevelt Memorial Park.

Mr. and Mrs. H. H. Dolley, Mr. and Mrs. W. C. Dolley, and Mr. and Mrs. Ellis Harner enjoyed a delightful Easter dinner at the Surf and Sand Club at Hermosa Beach.

McNabb Explains Dahlia Growing

Expert Details Flower Culture from Planting to Picking

By FRED C. McNABB The subject of Dahlias is a very timely one as this is what commercial growers consider the beginning of the planting season.

Of course, I understand that many Dahlias have been planted, but nevertheless, the fact remains that April 1 is considered the beginning of planting season by those who know and who succeed.

Assuming that the soil has been treated and well prepared, the first thing in order is to set your Dahlia stakes. Drive the stake into the ground about fifteen or eighteen inches and then attach your labels.

I suggest the copper wired painted-iron label. Write the name on this label with a weather proof pencil and it will last throughout the season. A small staple or nail may be driven into the stake near the top, and the label attached to it.

Now dig a hole and place the tuber in a horizontal position with the eye up and the eye end nearest the stake. About two inches from the stake is a good distance. Cover the tuber to a depth of about three and one-half inches in heavy soil and five to six inches in light sandy soil. Remember that it is well to have the eye on the tuber showing at the time of planting, and it is well to delay planting until the eyes do show. They may be encouraged to grow more quickly by placing the tuber in light sawdust or sand.

About Water If the soil is moist, and in good condition at the time of planting, it will not be necessary to apply water until after the sprout shows through the surface. Watering before the sprout shows through may decay the tuber and, further, it has a tendency to cement the soil so firmly around the tuber and the sprout that the sprout will find difficulty in reaching the surface. Remember that there is sufficient nutriment in the Dahlia tuber to grow a sprout of considerable length without any great amount of moisture, and so it is not necessary to water at least until the sprout has come through the surface. In a very heavy adobe soil it is well to place clean river sand around the tuber. This will provide drainage, and it may further be of assistance to the tender sprout as it grows.

When the sprout shows through the surface, spraying should begin to prevent thrip, and the spraying should continue at frequent intervals until the plant is well established. A spray solution of two teaspoons Destruxol to one gallon of water is suggested. Nico Garden Dust is also used by many commercial growers for the control of thrip. Overhead sprinkling will assist in controlling red spider and other garden pests. At the same time it is generally believed that overhead sprinkling is beneficial to the plants, especially after they have grown to a size of fifteen to eighteen inches in height.

Cultivation Important Cultivation is very important, and the soil should be worked after each irrigation or sprinkling. After the plants have grown to full size the cultivation should be more shallow and perhaps a little greater distance from the plant, that the fibrous roots may not be disturbed. The Dahlia requires considerable water after the plants have been established and have begun to bloom. It may be well not to depend entirely on sprinkling to supply this moisture unless the sprinklers are allowed to run for a considerable length of time. During the hot summer months irrigation, in addition to sprinkling, may be needed to supply the greater amount of water needed at that time.

For best results Dahlias must be planted in the open where they will receive full sunshine and they should be disbudded. Proper disbudding will prevent Dahlias growing to such a height that the flowers cannot be reached without a step-ladder and a plant that is produced by disbudding is much more pleasing to the eye. When the plant is about eight or ten inches high, the top should be pinched out. This induces branching near the ground and the plant

is very much more easily handled. As the lateral branches grow, the side branches growing from the lateral branch should be removed from all of the joints or leaf pairs below the flower back to the first joint nearest the main stalk. But one bud should be left at the terminal of the lateral, and when the flower is ready to cut remove it with a long stem, cutting back to the first joint from the main stalk. The two side shoots coming from the leaf pair or joint nearest the main stalk should be left to grow, and these disbudded in the same way as suggested for the first lateral branch.

After Cutting Each time a flower is cut there should be two flowers come from the first joint from the main stalk that is left, therefore, the number of flowers per plant are doubled each crop that is cut. As an example, if you have a plant with six or eight laterals, your first crop of flowers would be one flower from each lateral, but the second crop would be twice as many flowers, and as the season advances there will be a greater number of flowers, and they will be smaller. To keep them a good size it is well sometimes to remove a few of the extra laterals about the second or third crop of flowers, thus reducing the number and enlarging them.

If you do not know how to disbud your Dahlias, you must learn, for you cannot appreciate the Dahlia as you should unless it is disbudded. Our Bulletin Number Ten, Cultural Directions for Dahlias, contains a diagram which will be of assistance to you in disbudding, and you may have it for the asking. It may be secured at our Retail Store, 750 South Spring street, or at any Aggeler and Musser Dealer throughout Southern California, or by writing to me direct in care of K.H.J.

If you do not have your own Dahlia tubers, you must be sure to secure them from a reliable source. Tubers that are heavily fertilized to produce the finest flowers for market are not good reproducers. That is something for you to remember in your own Dahlia growing. Do not fertilize too heavily to produce large flowers for you do so at the expense of your tuber the following year.
